DRIVER'S HANDBOOK · MODEL G2-200

GAS 2 1.0.19

PREMIUM FUEL
MODEL G2-200

Premium fuel for your mix.

A master-bus color plugin. One big dial makes a mix thicker, smoother and more glued, a hidden fuel filter takes out the harsh stuff, and the output stays level-matched, so every move is judged on color, not volume.

01 THE FUEL LINE

IN → Fuel filter → Color → Auto-level → OUT

- **Fuel filter:** turns down narrow, ringing peaks only while they ring. No knob: it follows GAS and the grade.
- **Color:** weight in the lows, clear mids, silky air, gentle glue, oversampled saturation.
- **Auto-level:** output loudness = input loudness. At GAS 0 % it's a clean wire. It never limits or clips.

02 BOLT IT IN

- **VST3, AU & AAX**, macOS & Windows 64-bit. Run the installer, then **Rescan** plug-ins in your DAW. No key needed.
- Mount it **first on the master bus** (or any mix bus). A limiter goes last: GAS 2 into RevLimiter.
- About 22 ms latency, compensated by your DAW. Bypass it when tracking live through the master.

DIAL	GRADES	OUTPUT	READOUT	FORMATS
0–200 %	3	MATCHED	LUFS	VST3·AU·AAX

03 THE PUMP

GAS 0 … 200 %	The big dial (face reads AMOUNT). 100 % points straight up; the color comes in fast up to ~120 %. **120–200 % is the push zone**: denser and heavier, not brighter or wider.
IN −12 … +12 dB	Drive into the color: more saturation and glue. The level stays put, so it's a character knob, not a volume knob.
OUT −12 … +12 dB	Your final level. Sets how hard you hit the next plugin.
Thumbwheels fine adjust	The knurled wheel on each IN / OUT dial moves it 10× finer.
LUFS counter readout	Short-term loudness of the output. Dash flaps drop when there's no signal.

04 PICK YOUR GRADE

REGULAR

Smooth, warm, rounded. For mixes that just want a finish.

PREMIUM

The signature: thick lows, clear mids, silky air, glued.

RACE

Punchy, bright, forward. GAS 2 opens here, at 160 %.

05 DASH MOVES & THE SERVICE CARD

- **Drag** up / down to turn; **Shift** = 10× finer. **Scroll** works too.
- **Double-click** to reset: GAS → 160 %, IN / OUT → 0 dB.
- IN, GAS, GRADE and OUT are all automatable.
- Click the **REVAUDIO plate** for the service card (Esc closes).
- **FLOATING** = the pump stands on your session; **ROOM** = its own window. **Size** 50–100 %, or drag the corner.
- While floating, the red **EXIT** on the crown closes it.

06 FILL UP IN THREE

1. **Insert it first** on the master bus, with your limiter last.
2. **Pick a grade, pour the GAS.** Start at 100 % and A/B with your DAW's bypass (it's level-matched, so it's fair). Push past 120 % for density.
3. **Drive and trim.** +3 to +6 dB of IN on thin mixes; OUT sets how hard you hit the limiter.

> **PIT-CREW TIP** Too forward on a soft song? Switch grade before you back off the GAS.
